Motivating Example

What are the capital cities of European countries?

	France	Italy	Poland	Romania	Hungary
Alice	Paris	Rome	Warsaw	Bucharest	Budapest
Bob	?	Rome	Warsaw	Bucharest	Budapest
Charlie	Paris	Rome	Katowice	Bucharest	Budapest
David	Paris	Rome	Bratislava	Budapest	Sofia
Eve	Paris	Florence	Warsaw	Budapest	Sofia
Fred	Rome	?	?	Budapest	Sofia
George	Rome	?	?	?	Sofia

Information: redundance

	France	Italy	Poland	Romania	Hungary
Alice	Paris	Rome	Warsaw	Bucharest	Budapest
Bob	?	Rome	Warsaw	Bucharest	Budapest
Charlie	Paris	Rome	Katowice	Bucharest	Budapest
David	Paris	Rome	Bratislava	Budapest	Sofia
Eve	Paris	Florence	Warsaw	Budapest	Sofia
Fred	Rome	?	?	Budapest	Sofia
George	Rome	?	?	?	Sofia
Frequency	P. 0.67 R. 0.33	R. 0.80 F. 0.20	W. 0.60 K. 0.20 B. 0.20	Buch. 0.50 Bud. 0.50	Bud. 0.43 S. 0.57
Decision	Paris	Rome	Warsaw	?	Sofia

Evaluating Trustworthiness of Sources

Information: redundance, trustworthiness of sources (= average frequency of predicted correctness)

	France	Italy	Poland	Romania	Hungary	Trust
Alice	Paris	Rome	Warsaw	Bucharest	Budapest	0.60
Bob	?	Rome	Warsaw	Bucharest	Budapest	0.58
Charlie	Paris	Rome	Katowice	Bucharest	Budapest	0.52
David	Paris	Rome	Bratislava	Budapest	Sofia	0.55
Eve	Paris	Florence	Warsaw	Budapest	Sofia	0.51
Fred	Rome	?	?	Budapest	Sofia	0.47
George	Rome	?	?	?	Sofia	0.45
Frequency weighted by trust	P. 0.70 R. 0.30	R. 0.82 F. 0.18	W. 0.61 K. 0.19 B 0.20	Buch. 0.53 Bud. 0.47	Bud. 0.46 S. 0.54	
Decision	Paris	Rome	Warsaw	Bucharest	Sofia	

Iterative Fixpoint Computation

Information: redundance, trustworthiness of sources with iterative fixpoint computation

	France	Italy	Poland	Romania	Hungary	Trust
Alice	Paris	Rome	Warsaw	Bucharest	Budapest	0.65
Bob	?	Rome	Warsaw	Bucharest	Budapest	0.63
Charlie	Paris	Rome	Katowice	Bucharest	Budapest	0.57
David	Paris	Rome	Bratislava	Budapest	Sofia	0.54
Eve	Paris	Florence	Warsaw	Budapest	Sofia	0.49
Fred	Rome	?	?	Budapest	Sofia	0.39
George	Rome	?	?	?	Sofia	0.37
Frequence weighted by trust	P. 0.75 R. 0.25	R. 0.83 F. 0.17	W. 0.62 K. 0.20 B 0.19	Buch. 0.57 Bud. 0.43	Bud. 0.51 S. 0.49	
Decision	Paris	Rome	Warsaw	Bucharest	Budapest	

- There might be **no explicit contradictions** between facts stated by different sources:
 - “Paris is a city of France.”
 - “Lyon is a city of France.”
 - “Bolzano is a city of France.”
 - \neg “New York is a city of France.”
- We want to exploit the fact that **some facts are harder** than other (capital of France vs capital of Vanuatu).

- **Context:**
 - Set of sources stating facts
 - (Possible) functional dependencies between facts
 - **Fully unsupervised setting:** we do not assume any information on the truth values of facts or the inherent trust of sources
- **Problem:** determine which facts are true and which facts are false
- **Real world applications:** query answering, source selection, data quality assessment on the web, making good use of the wisdom of crowds

- 1 Introduction
- 2 Model
- 3 Algorithms
- 4 Experiments
- 5 Conclusion

- 1 Introduction
- 2 Model
- 3 Algorithms
- 4 Experiments
- 5 Conclusion

- Set of facts $\mathcal{F} = \{f_1 \dots f_n\}$
 - Examples: “Paris is capital of France”, “Rome is capital of France”, “Rome is capital of Italy”
- Set of views (= sources) $\mathcal{V} = \{V_1 \dots V_m\}$, where a view is a partial mapping from \mathcal{F} to $\{T, F\}$
 - Example:
 - “Paris is capital of France” \wedge “Rome is capital of France”
- **Objective:** find the **most likely** real world W given \mathcal{V} where the real world is a total mapping from \mathcal{F} to $\{T, F\}$
 - Example:
 - “Paris is capital of France” \wedge \neg “Rome is capital of France” \wedge “Rome is capital of Italy”

- $\varphi(V_i)\varphi(f_j)$: probability that V_i “forgets” (does not state anything about) f_j
- $\varepsilon(V_i)\varepsilon(f_j)$: probability that V_i makes an error on f_j if V_i makes a statement about f_j
- **Number of parameters:** $n + 2(n + m)$ (n boolean parameters, $2(n + m)$ parameters between 0 and 1).
- **Size of data:** $\tilde{\varphi}nm$ with $\tilde{\varphi}$ the average forget rate

- **Method:** use this generative model to find the most likely parameters given the data
 - Inverse the generative model to compute the probability of a set of parameters given the data
 - Standard machine learning technique: Expectation-Maximization
- Not practically applicable:
 - Equations for inverting the generative model very complex (but doable)
 - **Large number of parameters** (n and m can both be quite large). Any exponential technique unpractical
 - **Non-linearity** of the model ($W(f_j)$ is boolean)
- \Rightarrow Heuristic fix-point algorithms

- **PageRank [BP98]**: Fix-point algorithm for computing authority scores on the Web
- Corresponds to the **equilibrium measure** of the random walk in the (slightly modified) Web graph
- Can it be applied directly?
 - Sources-Facts: bipartite graph. Random walks (obviously) do not converge in this setting.
 - Alternative: Graph of the two-steps paths in this bipartite graph. Random walks work, but it can be shown that the equilibrium measure is **proportional to the degree** (cf. method Counting further)
 - No clear notion how to manage negative statements (negative links)
- Source of inspiration for the methods presented

- 1 Introduction
- 2 Model
- 3 Algorithms**
- 4 Experiments
- 5 Conclusion

Counting (does not look at negative statements, **popularity**)

$$\begin{cases} T & \text{if } \frac{|\{V_i : V_i(f_j) = T\}|}{\max_f |\{V_i : V_i(f) = T\}|} \geq \eta \\ F & \text{otherwise} \end{cases}$$

Voting (adapted only with negative statements)

$$\begin{cases} T & \text{if } \frac{|\{V_i : V_i(f_j) = T\}|}{|\{V_i : V_i(f_j) = T \vee V_i(f_j) = F\}|} \geq 0.5 \\ F & \text{otherwise} \end{cases}$$

TruthFinder [YHY07]: heuristic fix-point method from the literature; context slightly different (Source-Object-Fact) and method most adapted to cases with very few errors, does not deal with contradiction

- 1 Estimate the truth of facts (e.g., with voting)
- 2 Based on that, estimate the error rates of sources
- 3 Based on that, refine the estimation for the facts
- 4 Based on that, refine the estimation for the sources
- 5 ...

Iterate until a **fix-point** is reached (and cross your fingers it converges!).

- The truth of a fact is what views state weighted by how error prone they are
- The error of a view is the correlation (= **cosine similarity**) between its statement of facts and the predicted truth of these facts

Precise algorithms are given in [GAMS09].

- A fact is true:
 - if a view states it is true and makes no error
 - or if a view states it is false and makes an error
- A view makes an error:
 - if it states a fact is true and the fact is false
 - if it states a fact is false and the fact is true
- Quite instable \Rightarrow **tricky normalization**

- Similar in spirit to 2-Estimates but estimation of 3 parameters:
 - truth value of facts
 - error rate or trustworthiness of sources
 - **hardness of facts**
- Also needs tricky normalization

- So far, the models and algorithms are about positive and negative statements, without correlation between facts
- How to deal with functional dependencies (e.g., capital cities)?
 - pre-filtering:** When a view states a value, all other values governed by this FD are considered **stated false**.
If I say that Paris is the capital of France, then I say that neither Rome nor Lyon nor ... is the capital of France.
 - post-filtering:** Choose the **best answer** for a given FD.

- 1 Introduction
- 2 Model
- 3 Algorithms
- 4 Experiments**
- 5 Conclusion

What to measure?

- Quality of binary classification: **percentage of error** for predicting the truth
- **Precision-Recall curve** for top- k rated facts (classical measure for search engine results)

On what data?

- **Synthetic dataset** closely based upon our generative model, with all possibilities of variation
- Various **real-world datasets**

We assume that error rates are less than 50%!

Typical Results over Synthetic Dataset

Champions League: Maccabi Haifa - Bayern Munchen, who will win on 15 Sep?

Suspend date: Tonight 8:45pm CEST (9 hours to go) [details >](#)

Activity: H\$9,494 | Predictions: 27 | [Comments: 1](#)

- Prediction network (sports, politics, business, etc.)
- Bets using virtual money
- (Small) sports dataset extracted: 357 questions, 1 to 20 answers, 473 users, 3,051 statements (before pre-filtering)

	Number of errors (no post-filtering)	Number of errors (with post-filtering)
Voting	278	292
Counting	340	327
TruthFinder	458	274
2-Estimates	269	269
Cosine	357	357
3-Estimates	272	270

	Number of errors (no post-filtering)	Number of errors (with post-filtering)
Voting	278	292
Counting	340	327
TruthFinder	458	274
2-Estimates	269	269
Cosine	357	357
3-Estimates	272	270

Possible to earn money on bets. Easy way to get rich!

General-Knowledge Quiz: 1/2

1. Where is the city of Ushuaia located?

- Don't know
- In Italy
- In Greece
- In Argentina
- In the Ivory Coast
- In Sweden
- In Malaysia

2. What is the last word of all three parts of Dante's *Divine Comedy* (*Hell* — *Purgatory* — *Paradise*)?

- Don't know
- "Stars" ("Stelle")
- "God" ("Dio")
- "Hope" ("Speranza")
- "Beatrice"

3. Who discovered the planet Uranus?

- Don't know
- Sir William Herschel (in 1781)
- Urbain Le Verrier (in 1846)
- Clyde Tombaugh (in 1930)
- Percival Lowell (in 1894)

■ 17 questions, 4 to 14 answers, 601 participants

	Number of errors (no post-filtering)	Number of errors (with post-filtering)
Voting	11	6
Counting	12	6
TruthFinder	-	-
2-Estimates	6	6
Cosine	7	6
3-Estimates	9	0

	Number of errors (no post-filtering)	Number of errors (with post-filtering)
Voting	11	6
Counting	12	6
TruthFinder	-	-
2-Estimates	6	6
Cosine	7	6
3-Estimates	9	0

Possible to know the correct answer to a quiz by just looking at all answers. Automatic correction of exams is possible!

It does not always work!

No magic!

- Does not take into account **dependencies between sources**
- Example: integration of search engine results
- Usually, when it “does not work”, 3-Estimates gives results comparable to the baseline, Cosine is not bad, 2-Estimates is very unstable

- 1 Introduction
- 2 Model
- 3 Algorithms
- 4 Experiments
- 5 Conclusion**

- One of the first works in **truth discovery** among disagreeing sources
- Collection of **fix-point** methods, one of them (3-Estimates) performing remarkably and regularly well
- We believe this is an important problem, we do not claim we have solved it completely
- Cool real-world applications!

All code and datasets available from
<http://datacorrob.gforge.inria.fr/>. Details in [GAMS09].

- Exploiting **dependencies between sources** [DBES09]
- **Numerical values** ($1.77m$ and $1.78m$ cannot be seen as two completely contradictory statements for a height)
- No clear functional dependencies, but a **limited number of values** for a given object (e.g., phone numbers)
- **Pre-existing trust**, e.g., in a social network
- Clustering of facts, each source being trustworthy **for a given field**

Merci.

The logo for 'Webdam' is rendered in a bold, blue, cursive script with a thick black outline. The letters are interconnected, giving it a dynamic and modern feel.
