Relational Algebra

Basics of SQL

References

## The relational algebra

- **Algebraic language** to express queries
- A relational algebra expression produces a **new relation** from the database relations
- Each operator takes 0, 1, or 2 **subexpressions**

- Main operators:

| Op.                      | Arity | Description   | Condition                       |
|--------------------------|-------|---------------|---------------------------------|
| $R$                      | 0     | Relation name | $R \in \mathcal{L}$             |
| $\rho_{A \rightarrow B}$ | 1     | Renaming      | $A, B \in \mathcal{L}$          |
| $\Pi_{A_1 \dots A_n}$    | 1     | Projection    | $A_1 \dots A_n \in \mathcal{L}$ |
| $\sigma_\varphi$         | 1     | Selection     | $\varphi$ formula               |
| $\times$                 | 2     | Cross product |                                 |
| $\cup$                   | 2     | Union         | schema-compatible               |
| $\setminus$              | 2     | Difference    | schema-compatible               |
| $\bowtie_\varphi$        | 2     | Join          | $\varphi$ formula               |

## Relation name

| Guest |             |                      |
|-------|-------------|----------------------|
| id    | name        | email                |
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

| Reservation |       |      |            |        |
|-------------|-------|------|------------|--------|
| id          | guest | room | arrival    | nights |
| 1           | 1     | 504  | 2026-01-01 | 5      |
| 2           | 2     | 107  | 2026-01-10 | 3      |
| 3           | 3     | 302  | 2026-01-15 | 6      |
| 4           | 2     | 504  | 2026-01-15 | 2      |
| 5           | 2     | 107  | 2026-01-30 | 1      |

Expression: Guest

Result:

| id | name        | email                |
|----|-------------|----------------------|
| 1  | John Smith  | john.smith@gmail.com |
| 2  | Alice Black | alice@black.name     |
| 3  | John Smith  | john.smith@ens.fr    |

# Renaming

| Guest |             |                      |
|-------|-------------|----------------------|
| id    | name        | email                |
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

| Reservation |       |      |            |        |
|-------------|-------|------|------------|--------|
| id          | guest | room | arrival    | nights |
| 1           | 1     | 504  | 2026-01-01 | 5      |
| 2           | 2     | 107  | 2026-01-10 | 3      |
| 3           | 3     | 302  | 2026-01-15 | 6      |
| 4           | 2     | 504  | 2026-01-15 | 2      |
| 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\rho_{id \rightarrow guest}(Guest)$

Result:

| guest | name        | email                |
|-------|-------------|----------------------|
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

# Projection

| Guest |             |                      |
|-------|-------------|----------------------|
| id    | name        | email                |
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

| Reservation |       |      |            |        |
|-------------|-------|------|------------|--------|
| id          | guest | room | arrival    | nights |
| 1           | 1     | 504  | 2026-01-01 | 5      |
| 2           | 2     | 107  | 2026-01-10 | 3      |
| 3           | 3     | 302  | 2026-01-15 | 6      |
| 4           | 2     | 504  | 2026-01-15 | 2      |
| 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{\text{email}, \text{id}}(\text{Guest})$

Result:

| email                | id |
|----------------------|----|
| john.smith@gmail.com | 1  |
| alice@black.name     | 2  |
| john.smith@ens.fr    | 3  |

# Selection

| Guest |             |                      |
|-------|-------------|----------------------|
| id    | name        | email                |
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

| Reservation |       |      |            |        |
|-------------|-------|------|------------|--------|
| id          | guest | room | arrival    | nights |
| 1           | 1     | 504  | 2026-01-01 | 5      |
| 2           | 2     | 107  | 2026-01-10 | 3      |
| 3           | 3     | 302  | 2026-01-15 | 6      |
| 4           | 2     | 504  | 2026-01-15 | 2      |
| 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\sigma_{\text{arrival} > 2026-01-12 \wedge \text{guest} = 2}(\text{Reservation})$

Result:

| id | guest | room | arrival    | nights |
|----|-------|------|------------|--------|
| 4  | 2     | 504  | 2026-01-15 | 2      |
| 5  | 2     | 107  | 2026-01-30 | 1      |

The formula used in the selection can be any **Boolean combination** of **comparisons** of attributes to attributes or constants.

# Cross product

| Guest |             |                      |
|-------|-------------|----------------------|
| id    | name        | email                |
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

| Reservation |       |      |            |        |
|-------------|-------|------|------------|--------|
| id          | guest | room | arrival    | nights |
| 1           | 1     | 504  | 2026-01-01 | 5      |
| 2           | 2     | 107  | 2026-01-10 | 3      |
| 3           | 3     | 302  | 2026-01-15 | 6      |
| 4           | 2     | 504  | 2026-01-15 | 2      |
| 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{id}(\text{Guest}) \times \Pi_{name}(\text{Guest})$

Result:

| id | name        |
|----|-------------|
| 1  | Alice Black |
| 2  | Alice Black |
| 3  | Alice Black |
| 1  | John Smith  |
| 2  | John Smith  |
| 3  | John Smith  |

## Cross product

| Guest |             |                      | Reservation |       |      |            |        |
|-------|-------------|----------------------|-------------|-------|------|------------|--------|
| id    | name        | email                | id          | guest | room | arrival    | nights |
| 1     | John Smith  | john.smith@gmail.com | 1           | 1     | 504  | 2026-01-01 | 5      |
| 2     | Alice Black | alice@black.name     | 2           | 2     | 107  | 2026-01-10 | 3      |
| 3     | John Smith  | john.smith@ens.fr    | 3           | 3     | 302  | 2026-01-15 | 6      |
|       |             |                      | 4           | 2     | 504  | 2026-01-15 | 2      |
|       |             |                      | 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{id}(\text{Guest}) \times \Pi_{name}(\text{Guest})$

Result:

| id | name        |
|----|-------------|
| 1  | Alice Black |
| 2  | Alice Black |
| 3  | Alice Black |
| 1  | John Smith  |
| 2  | John Smith  |
| 3  | John Smith  |

Cross product is rarely useful on its own, most often as part of a join.

# Union

| Guest |             |                      | Reservation |       |      |            |        |
|-------|-------------|----------------------|-------------|-------|------|------------|--------|
| id    | name        | email                | id          | guest | room | arrival    | nights |
| 1     | John Smith  | john.smith@gmail.com | 1           | 1     | 504  | 2026-01-01 | 5      |
| 2     | Alice Black | alice@black.name     | 2           | 2     | 107  | 2026-01-10 | 3      |
| 3     | John Smith  | john.smith@ens.fr    | 3           | 3     | 302  | 2026-01-15 | 6      |
|       |             |                      | 4           | 2     | 504  | 2026-01-15 | 2      |
|       |             |                      | 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{\text{room}}(\sigma_{\text{guest}=2}(\text{Reservation})) \cup \Pi_{\text{room}}(\sigma_{\text{arrival}=2026-01-15}(\text{Reservation}))$

Result:

|      |
|------|
| room |
| 107  |
| 302  |
| 504  |

# Union

| Guest |             |                      | Reservation |       |      |            |        |
|-------|-------------|----------------------|-------------|-------|------|------------|--------|
| id    | name        | email                | id          | guest | room | arrival    | nights |
| 1     | John Smith  | john.smith@gmail.com | 1           | 1     | 504  | 2026-01-01 | 5      |
| 2     | Alice Black | alice@black.name     | 2           | 2     | 107  | 2026-01-10 | 3      |
| 3     | John Smith  | john.smith@ens.fr    | 3           | 3     | 302  | 2026-01-15 | 6      |
|       |             |                      | 4           | 2     | 504  | 2026-01-15 | 2      |
|       |             |                      | 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{\text{room}}(\sigma_{\text{guest}=2}(\text{Reservation})) \cup$   
 $\Pi_{\text{room}}(\sigma_{\text{arrival}=2026-01-15}(\text{Reservation}))$

Result: room  
107  
302  
504

This simple union could have been written

$\Pi_{\text{room}}(\sigma_{\text{guest}=2 \vee \text{arrival}=2026-01-15}(\text{Reservation}))$ . Not always possible.

## Difference

| Guest |             |                      |
|-------|-------------|----------------------|
| id    | name        | email                |
| 1     | John Smith  | john.smith@gmail.com |
| 2     | Alice Black | alice@black.name     |
| 3     | John Smith  | john.smith@ens.fr    |

| Reservation |       |      |            |        |
|-------------|-------|------|------------|--------|
| id          | guest | room | arrival    | nights |
| 1           | 1     | 504  | 2026-01-01 | 5      |
| 2           | 2     | 107  | 2026-01-10 | 3      |
| 3           | 3     | 302  | 2026-01-15 | 6      |
| 4           | 2     | 504  | 2026-01-15 | 2      |
| 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{\text{room}}(\sigma_{\text{guest}=2}(\text{Reservation})) \setminus$   
 $\Pi_{\text{room}}(\sigma_{\text{arrival}=2026-01-15}(\text{Reservation}))$

Result:

|      |
|------|
| room |
| 107  |

# Difference

| Guest |             |                      | Reservation |       |      |            |        |
|-------|-------------|----------------------|-------------|-------|------|------------|--------|

|       |             |                      | 4           | 2     | 504  | 2026-01-15 | 2      |
|       |             |                      | 5           | 2     | 107  | 2026-01-30 | 1      |

Expression:  $\Pi_{\text{room}}(\sigma_{\text{guest}=2}(\text{Reservation})) \setminus \Pi_{\text{room}}(\sigma_{\text{arrival}=2026-01-15}(\text{Reservation}))$

Result:             
          room  
            
          107  
          

This simple difference could have been written  $\Pi_{\text{room}}(\sigma_{\text{guest}=2 \wedge \text{arrival} \neq 2026-01-15}(\text{Reservation}))$ . Not always possible.

Note: EXCEPT has been added fairly recently (2022) to MySQL.

Result:

| id | guest | room | arrival    | nights | name        | email                |
|----|-------|------|------------|--------|-------------|----------------------|
| 1  | 1     | 504  | 2026-01-01 | 5      | John Smith  | john.smith@gmail.com |
| 2  | 2     | 107  | 2026-01-10 | 3      | Alice Black | alice@black.name     |
| 3  | 3     | 302  | 2026-01-15 | 6      | John Smith  | john.smith@ens.fr    |
| 4  | 2     | 504  | 2026-01-15 | 2      | Alice Black | alice@black.name     |
| 5  | 2     | 107  | 2026-01-30 | 1      | Alice Black | alice@black.name     |

The formula used in the join can be any **Boolean combination** of **comparisons** of attributes of the table on the left to attributes of the table on the right.

## Note on the join

- The join is not an **elementary** operator of the relational algebra (but it is very useful)
- It can be seen as a **combination** of renaming, cross product, selection, projection
- Thus:

$$\begin{aligned} & \text{Reservation} \bowtie_{\text{guest=id}} \text{Guest} \\ \equiv & \Pi_{\text{id,guest,room,arrival,nights,name,email}} ( \\ & \sigma_{\text{guest=temp}} (\text{Reservation} \times \rho_{\text{id} \rightarrow \text{temp}} (\text{Guest})) ) \end{aligned}$$

- If  $R$  and  $S$  have for attributes  $\mathcal{A}$  and  $\mathcal{B}$ , we note  $R \bowtie S$  the **natural join** of  $R$  and  $S$ , where the join formula is  $\bigwedge_{A \in \mathcal{A} \cap \mathcal{B}} R.A = S.A$ .

## Illegal operations

- All expressions of the relational algebra are not **valid**
- The validity of an expression generally depends on the database schema
- For example:
  - No reference to the name of a relation that doesn't exist in the database schema
  - One cannot reference (within a renaming, projection, selection, join) an attribute that does not exist in the result of a sub-expression
  - One cannot compute the union or difference of two relations with different schemas
  - One cannot produce (cross product, join, renaming) a table with two attributes with the same name
- Systems implementing the relational algebra may do a static or dynamic verification of these rules, or sometimes ignore them

## End-to-end example (relational algebra)

| Guest |             |                      | Reservation |       |      |            |        |
|-------|-------------|----------------------|-------------|-------|------|------------|--------|
| id    | name        | email                | id          | guest | room | arrival    | nights |
| 1     | John Smith  | john.smith@gmail.com | 1           | 1     | 504  | 2026-01-01 | 5      |
| 2     | Alice Black | alice@black.name     | 2           | 2     | 107  | 2026-01-10 | 3      |
| 3     | John Smith  | john.smith@ens.fr    | 3           | 3     | 302  | 2026-01-15 | 6      |
|       |             |                      | 4           | 2     | 504  | 2026-01-15 | 2      |
|       |             |                      | 5           | 2     | 107  | 2026-01-30 | 1      |

Question: Which **emails** correspond to guests who have a reservation for **room 504**?

Expression:  $\Pi_{\text{email}}(\sigma_{\text{room}=504}(\text{Reservation} \bowtie_{\text{guest}=\text{id}} \text{Guest}))$

Result:

| email                |
|----------------------|
| john.smith@gmail.com |
| alice@black.name     |

This is: join  $\rightarrow$  select  $\rightarrow$  project

## Bag semantics

In bag semantics (what is actually used by RDBMS):

- All operations return **multisets**
- In particular, projection and union can **introduce** multisets even when initial relations are sets

# Outline

Relational Algebra

Basics of SQL

References

# SQL

- **Structured Query Language**, standard language (ISO/IEC 9075, several versions [ISO, 1987, 1999]) to **interact with an RDBMS**
- Unfortunately, implementation of the standard very **variable** from one RDBMS to the next
- Many little things (e.g., available types) vary between RDBMSs instead of following the standard
- Differences more **syntactical** than major
- Where it makes a difference, we use the **MySQL** version
- Two main parts: DDL (**Data Definition Language**) to define the schema and DML (**Data Manipulation Language**) to query and update data
- **Declarative** language: express what you mean, the system will take care of translating this into an **efficient execution plan**

## Syntax of SQL

- Quite **verbose**, designed to be almost readable as English words [Chamberlin and Boyce, 1974]
- Keywords are **case-insensitive**, traditionally written in all uppercase
- Identifiers are either **case-sensitive** or **case-insensitive**, depending on the RDBMS and its configuration
- I will try using the following conventions:
  - keywords: upper case
  - table names: capitalized
  - attribute names: lower case
- **Comments** introduced with **--**
- SQL statements end with a **“;”** in some contexts (e.g., command line client) but the **“;”** is not properly part of the statement

# NULL

- In SQL, NULL is a special value that an attribute can take within a tuple
- Denotes **absence of value**
- Different from 0, from an empty string, etc.
- Weird **tri-valued** logic: True, False, NULL
- A normal comparison (equality, inequality, etc.) with NULL always returns NULL
- **IS NULL**, **IS NOT NULL** can be used to test whether a value is NULL
- When evaluating a selection predicate, values evaluating to **FALSE** or **NULL** are both rejected

# Data Definition Language

SQL

```
CREATE TABLE Guest(id INTEGER, name TEXT, email VARCHAR(256));  
CREATE TABLE Reservation(id INTEGER, guest INTEGER,  
    room INTEGER, arrival DATE, nights INTEGER);
```

But also:

- `DROP TABLE Guest;` to destroy a table
- `RENAME TABLE Guest TO Guest2;` to rename a table
- `ALTER TABLE Guest MODIFY COLUMN id TEXT;`  
to change the type of a column

## Constraints

Specified at the creation of a table, or added later on (with **ALTER TABLE**)

**PRIMARY KEY** for the primary key; only one per table, it is the key that will be used for physical organization of data; implies **NOT NULL**

**UNIQUE** for other keys

**REFERENCES** for foreign keys

**CHECK** for Check constraints

**NOT NULL** to indicate that an attribute cannot take the NULL value

# Constraints

**SQL**

```
CREATE TABLE Guest(  
  id INTEGER PRIMARY KEY,  
  name TEXT NOT NULL,  
  email VARCHAR(256) UNIQUE CHECK (email LIKE '%@%')  
);
```

```
CREATE TABLE Reservation(  
  id INTEGER PRIMARY KEY,  
  guest INTEGER NOT NULL REFERENCES Guest(id),  
  room INTEGER NOT NULL CHECK (room>0  
    AND room<651),  
  arrival DATE NOT NULL,  
  nights INTEGER NOT NULL CHECK (nights>0),  
  UNIQUE(room, arrival),  
  UNIQUE(guest, arrival)  
);
```

## Updates

- Insertions:

```
INSERT INTO Guest(id,name) VALUES (5, 'John');
```

- Deletions:

```
DELETE FROM Reservation WHERE id>4;
```

- Modifications:

```
UPDATE Reservation SET room=205 WHERE room=204;
```

# Updates

SQL

```
INSERT INTO Guest VALUES
```

```
(1, 'John Smith', 'john.smith@gmail.com'),  
(2, 'Alice Black', 'alice@black.name'),  
(3, 'John Smith', 'john.smith@ens.fr');
```

```
INSERT INTO Reservation VALUES
```

```
(1, 1, 504, '2026-01-01', 5),  
(2, 2, 107, '2026-01-10', 3),  
(3, 3, 302, '2026-01-15', 6),  
(4, 2, 504, '2026-01-15', 2),  
(5, 2, 107, '2026-01-30', 1);
```

## Queries

General following form:

**SQL**

```
SELECT ... FROM ... WHERE ...  
GROUP BY ... HAVING ...  
UNION SELECT ... FROM ...
```

**SELECT** projection, renaming, aggregation

**FROM** cross product

**WHERE** selection (optional)

**GROUP BY** grouping (optional)

**HAVING** selection on the grouping (optional)

**UNION** union (optional)

Other keywords: **ORDER BY** to reorder, **LIMIT** to limit to first  $k$  results, **DISTINCT** to impose set semantics, **EXCEPT** for set difference, etc.

# Renaming

| Guest |             |                      |
